Avera 

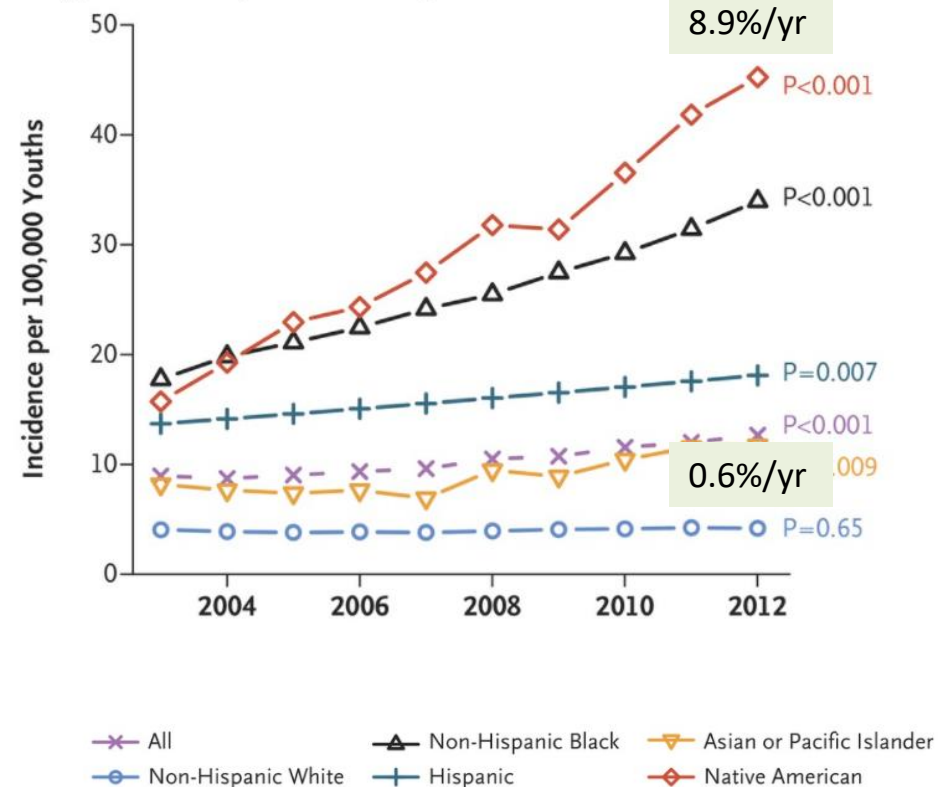

Overview

- Background and Rationale
 - Impact of diabetes
 - Colonization and diabetes
 - Social determinants of health
- Methods and Approach
- Results
- Discussion
- Future Directions

Background and Rationale

- Type 2 diabetes (T2D) incidence in youth is increasing globally and disproportionately affects indigenous people worldwide. (Chen et al, 2011)
- Native American youth have higher incidence of T2D than other racial/ethnic groups (Dabelea et al, 2007; Mayer-Davis et al, 2017)

B Type 2 Diabetes, 10–19 Yr of Age

Background and Rationale

- Complications and comorbidities in youth with diabetes may initiate early in the diabetes process. (Jensen et al, 2017)
- Type 2 diabetes contributes to a high burden of disease-associated complications and comorbidities. (Dabelea et al, 2017)

Estimated prevalence of complications and comorbidities in type 2 diabetes at age 21 in SEARCH

Background and Rationale

The Staggering Costs of Diabetes

2.3x greater health care costs for Americans with diabetes

\$327B annual cost of diagnosed diabetes in America

34M

More than 34 million Americans have diabetes

By county

- less than average: 0-6%
- national average: 7-10%
- above average: 11% or higher

88M

More than 88 million Americans have prediabetes

Today in America

\$1 in \$7

Health care dollars is spent treating diabetes and its complications

02/2020

...THIS IS SERIOUS!!

Background and Rationale

- Emerging research links social determinants of health with T2D (Utz et al, 2014)
- Few studies have examined youth T2D and:
 - Spatial differences (Liese et al, 2010; Geraghty et al, 2010; Lee et al, 2008; Green et al, 2003)
 - Rural areas (Lee et al, 2008)
 - American Indians
- History of colonization and continued inequalities in the Indigenous populations may explain this increase in diabetes.

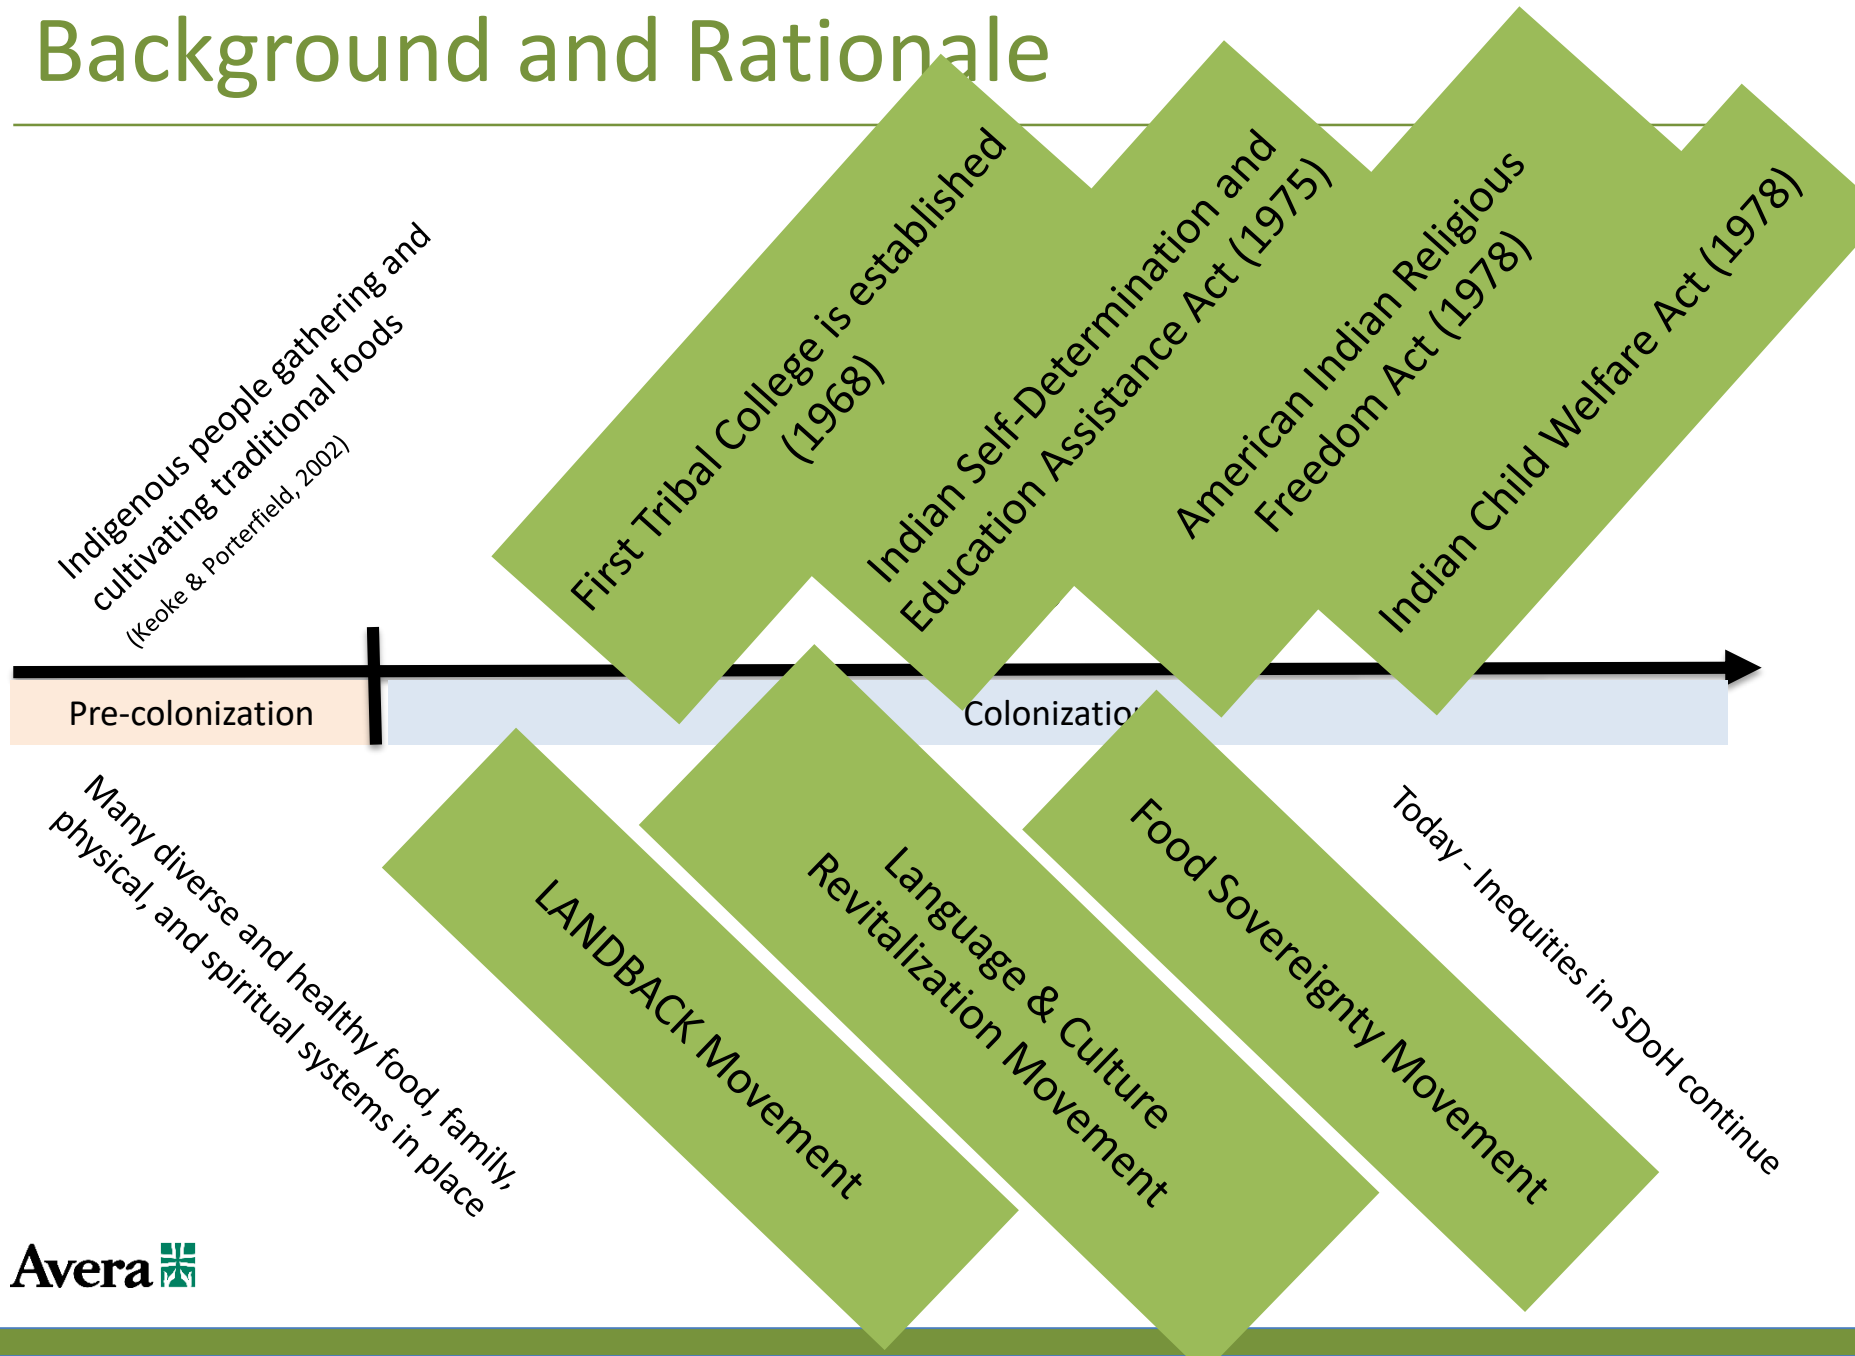

Background and Rationale

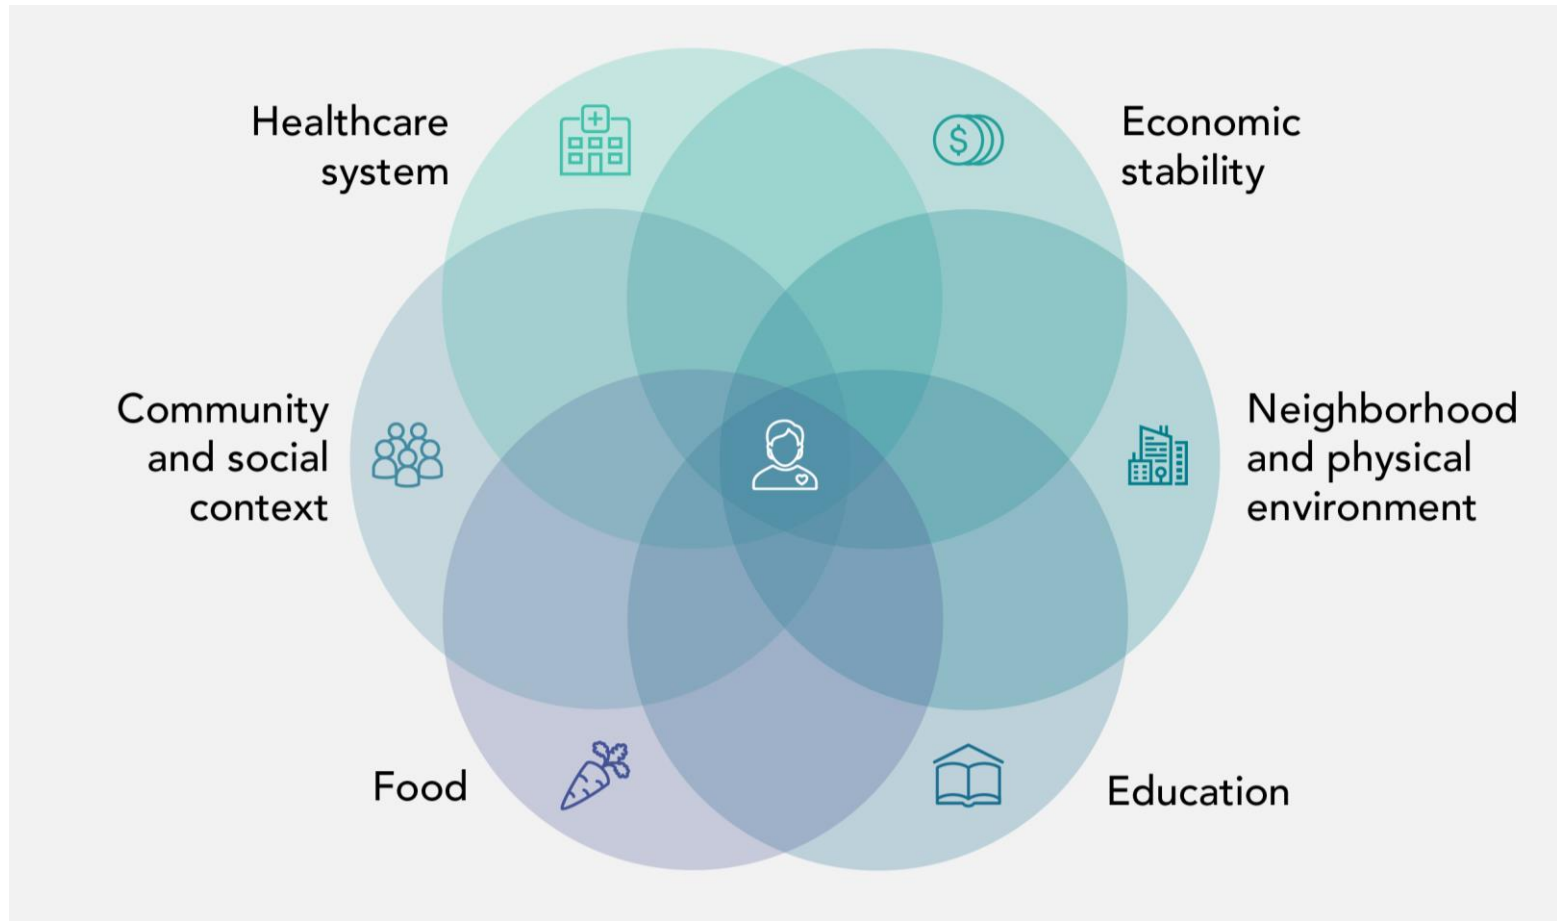

Background and Rationale

Resilience and strength
are also evident.

Background and Rationale

Social Determinants of Health

Research Objectives

1. Identify spatial clusters of incident type 2 diabetes cases in American Indian youth aged 0-19 years.
2. Determine what social determinants of health characteristics are associated with increased incidence of T2D among American Indian youth.

Outcome: Incidence of T2D

- Data Source: SEARCH for Diabetes in Youth
- Youth aged 0-19 years who
 - were active health system users of tribally-operated or IHS-operated regional health facilities.
 - diagnosed by a physician with T2D, confirmed by medical record abstraction
- Cases ascertained from 2002 through 2016 were used.

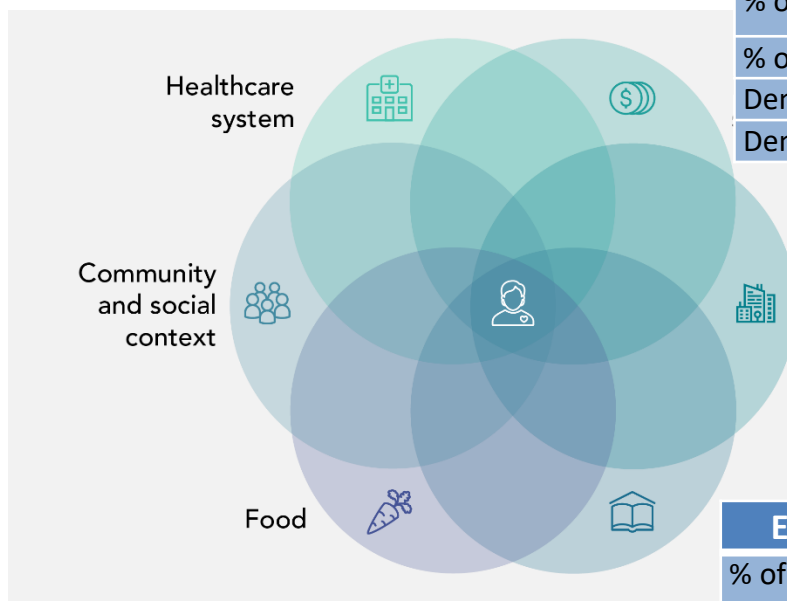

Outcome: Incidence of T2D

- Cases aggregated to community-level → ecological study design
- 2010 US Census population used for denominator

Social Determinants of Health

** means (SD) presented across all communities; densities are presented as average # per community.

Economic Stability

% of Individuals with Income Below Federal Poverty Level [†]	39.9% ± 14.2%
% of Households Receiving SNAP [†]	24.6% ± 11.4%
% of Workers without Access to a Vehicle [†]	5.1% ± 10.6%
Density of Highways [‡]	5.0 ± 7.6
Density of Tribal and County Roads [‡]	76.5 ± 54.8

Neighborhood and Physical Environment

% of Housing Units without Complete Plumbing [†]	47.0% ± 15.3%
% of Housing Units without Complete Kitchens [†]	44.4% ± 13.6%

Education

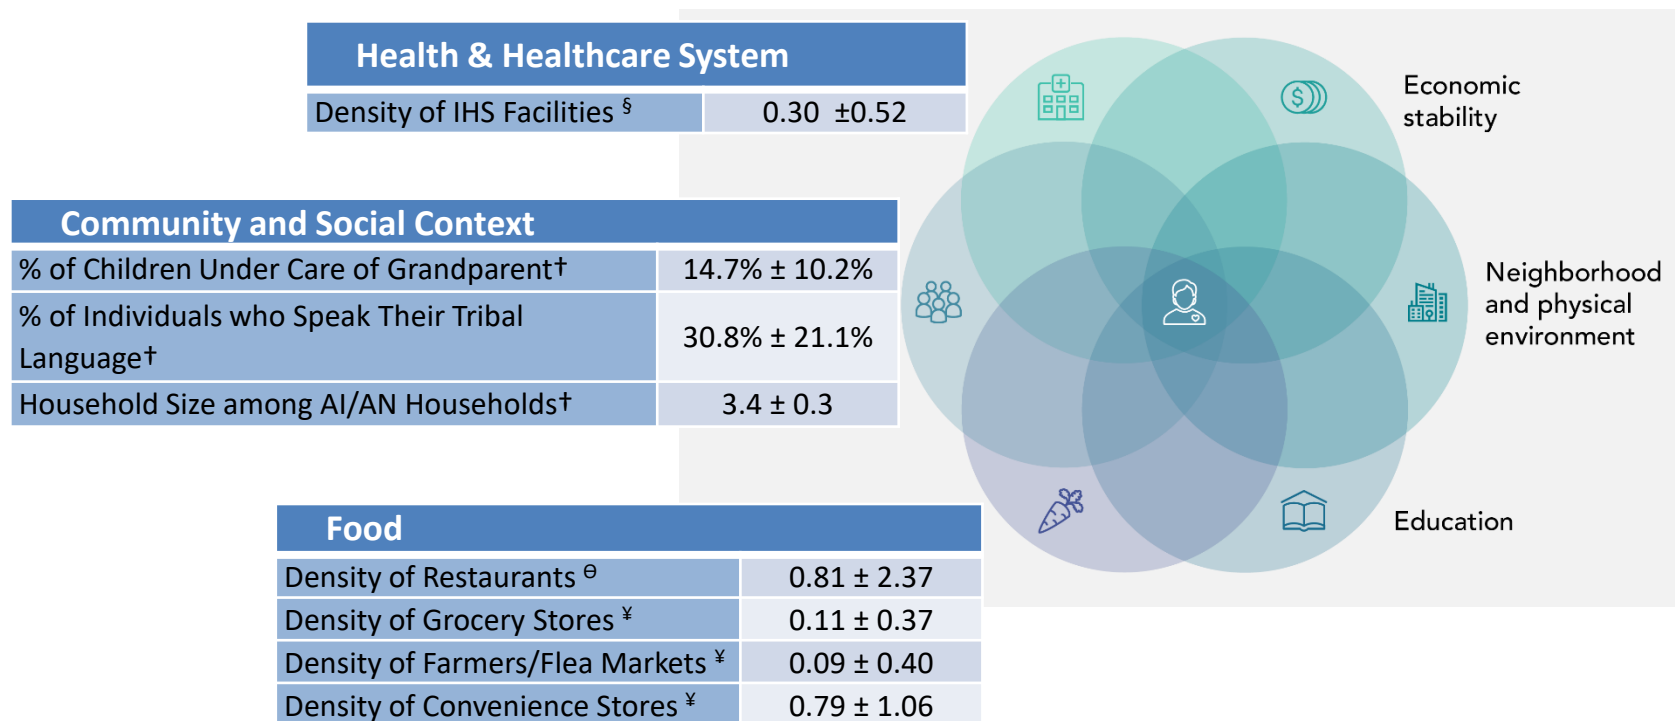

% of Individuals Age 25-64 with less than a High School Education [†]	27.9% ± 11.9%
Density of Schools ^ψ	1.3 ± 1.4

Data Sources: * SEARCH for Diabetes in Youth, 2002-2016; [‡] US Census, 2010; [†] American Community Survey, 2010

Methods: Cluster Analysis

- Cluster analysis, using the spatial scan statistic, was carried out in the SaTScan software package (Kulldorff, 2018).
 - Community-level analysis, similar to counties
 - Discrete Poisson model
 - Observed vs. expected
 - Reference population: Incidence of non-Hispanic Whites (SEARCH data)
 - Spatial cluster shape and size: circular window, 25%
 - Monte Carlo simulations: 999
- Clusters of communities with high incidence of diabetes were identified at $p < 0.05$.

Methods: Social Determinants of Health Regression

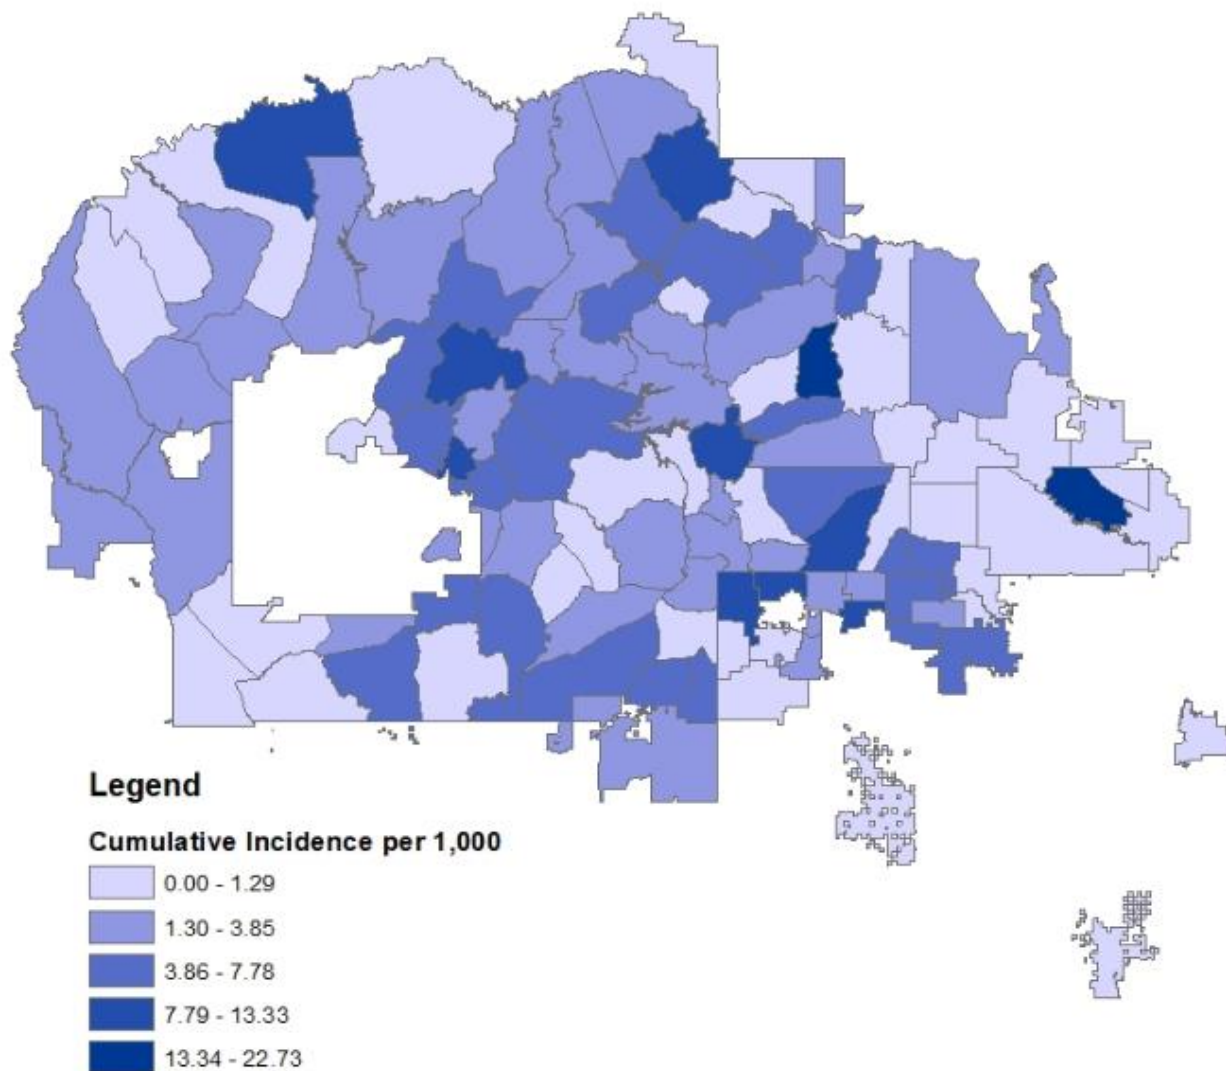

- Linear regression
 - Outcome: Community-level incidence of T2D
- Backward stepwise approach to identify the most significant variable(s) within each social determinants of health domain associated with the incidence of youth T2D
- Adjusted β coefficients and p-values were reported.

Results: Cluster Analysis

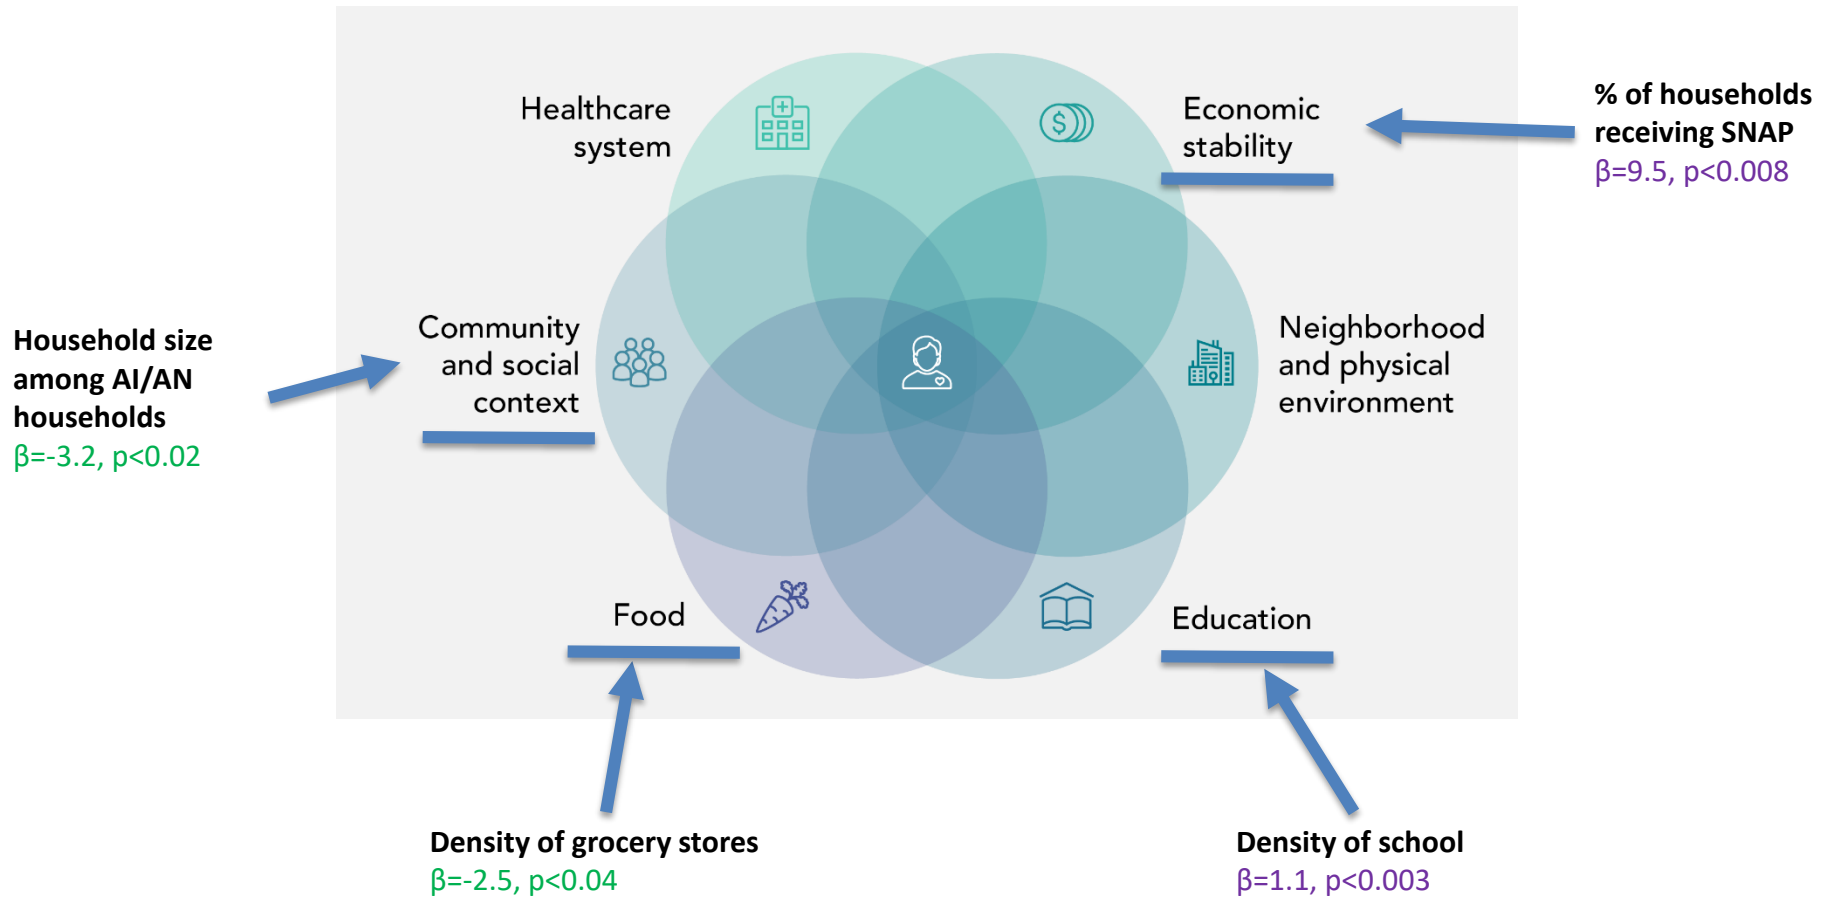

** Map of American Indian community

Results: Incidence of T2D

Results: Incidence of T2D

Discussion

- Disproportionately higher burden of T2D in the central communities.
- Models of social determinants of health indicate that some factors are playing important roles in the higher incidence of T2D in some communities
 - Economic Stability (SNAP): Ohri-Vachaspati et al. (2015) Lower SES related to greater prevalence of childhood obesity in low-income families in New Jersey
 - Food (grocery stores): Morland et al. (2006) At least one supermarket had lower prevalence of obesity in 4 US states.
 - Community & Social Context (household size): Pasala et al (2010) More social capital reduced risk of diabetes in urban Indian (from India) adults.
 - Education (schools): no previous literature.
- First known study to attempt to link health outcomes with social determinants of health in a rural American Indian community.

Strengths & Limitations

Limitations

- Ecological design
- Temporality concerns
- No behavioral, perceived, or quality measures
- Macro-level built environment measures used may lack necessary precision
- Emerging field

Strengths

- First time these datasets analyzed together
- Objective social determinants of health measures
- First spatial analysis of rural AI youth with T2D
- Hypothesis-generating
- Community-focused

Future Directions

- Finalize and disseminate infographic summarizing results
- Present and discuss findings with community stakeholders.
- Inform public health programs
 - Department of Health et al. – targeted, culturally-tailored, multi-level pediatric obesity and diabetes interventions and resources
 - COPE et al. – food system policy and improve access to healthy foods.
 - Funding opportunities – GusNIP provides incentives to purchase fruits and vegetables using SNAP dollars.
- Future Analyses
 - Better data
 - Evaluate impact
